Arrival of a truck
replayed Gate In (final) | arrival tree: hour, weekday
learned by ProSiT
Manifest (case attributes)
replayed (final) | one training manifest drawn as a whole
CTB adaptation
Control flow: repaired IM 0.0 as a state machine
one token per truck; enabled transitions = possible next steps
input / structure
Routing
one tree per transition: P(fires | manifest, stops done)
normalised over the enabled transitions
Stop guard (planned stops n, stops done c)
stop only if c < n; Gate Out only if c = n
Draw the next step
yard stop
Gate Out
token to the next place
Block of an RMG stop
observed block (final) | training shares | learned tree
Gate Out: visit ends
log: enabled, start and end of every event
Waiting time
tree per resource: queue length, workload, hour, ...
measured from a free lane
Capacity: 3 lanes per block
checked over the whole stop at its start;
exact count of trucks at the block
Execution time
tree per activity: other trucks at the block, block, hour, ...
